

## GARDEN PERENNIALS

### Coral Bells 'Ruby Bells'

*(Heuchera sanguinea 'Ruby Bells')*

A myriad of relatively large, showy, intense blood red flowers are held in well-branched panicles on 'Ruby Bells' and persist for 4-8 weeks beginning in late spring. Flowers have a subtle, sweet fragrance and make a bold statement in the garden. They even attract butterflies! Removing spent flower stalks will extend the bloom time. 'Ruby Bells' has green leaves and a compact mounding growth habit.

Coral Bells are easy to grow and blend easily with most other perennials in the landscape. Because of their low, mounding habit, they are often used as edging plants along paths or in containers. Try cutting a few of the tall flower stems for use in fresh bouquets. Foliage is 8-10" tall with flower stalks up to 16".
